

Have you considered Triple Glazing?

Triple glazed windows are even more energy-efficient than modern double glazing. The thermal insulation benefit is clearly visible through the additional pane of glass and gas filled cavity.

A few reasons why you should consider installing triple glazed windows:

1. **Save even more on your energy bills** - triple-glazed units have an optimized energy balance to maximise cost savings. Triple glazing allows a high level of solar heat gain, capturing free heat energy from outside during the daytime to warm the home. This is combined with exceptional thermal insulation properties with triple glazed units having a very low U-value (as low as .12, which is equal to R 8.33) to keep the heat in during night and day.
2. **Maximum comfort** - the thermal efficiency of triple-glazed units ensures that cold spots are eliminated. Triple glazed units also deliver excellent thermal acoustic performance, minimizing noise levels from outside.
3. **Enhanced security** - the extra pane of glass ensures that your windows are less easy to break through, giving you peace of mind when it comes to security.

Rising energy prices mean that it has never been so important to save as much as possible on your energy bills. Installing triple glazing will also reduce your carbon emissions.
